

THE ROAD AHEAD

Safety Information

After your first injection of Trelstar[®], you might feel a temporary increase in your cancer symptoms, such as pain in your bones. This is because the amount of testosterone in your bloodstream actually goes up for a short period after the injection. If your symptoms increase later than the first week or two following an injection, tell your doctor.

The most common side effects that patients taking Trelstar[®] have are actually the effect of lowering testosterone levels. The most common effect of lowering testosterone is hot flashes or flashes. These are like the hot flashes women have around the time of menopause. Other side effects include bone pain, impotence (sexual side effect), headache, leg pain, and swelling in the legs. Women who are or may become pregnant and those who are allergic to this type of drug should not take Trelstar[®]. For more information on these and other side effects, please talk to your doctor.
